GLOBAL SUPERSTORE DATA ANALYSIS

Power BI Dashboard Project Summary

Project Overview

This project uses the Global Superstore retail dataset to explore sales, profit, product performance, customer segments, and regional trends. Microsoft Power BI was used to build interactive visual reports that make business information easier to explore and interpret.

Objectives

- Prepare and organize retail data for analysis.
- Examine sales and profit across regions, markets, product sub-categories, and customer segments.
- Create interactive visuals and KPI cards to present key business measures.
- Use the dashboard to identify patterns and support data-informed business decisions.

Tools and Technologies

Tool	Purpose
Microsoft Excel	Initial data organization, cleaning, filtering, formulas, and PivotTables.
Power Query	Data cleaning, transformation, and preparation before analysis.
Microsoft Power BI	Data modeling, interactive dashboards, and visual analysis.
DAX	Measures and calculations for business metrics.

Dashboard Features

- KPI cards summarizing overall sales and profit.
- Charts comparing market and regional performance.
- Visuals for product sub-categories and customer segments.
- Interactive filtering to explore data by selected business dimensions.
- Charts and maps to make comparisons and trends easier to understand.

Key Findings Reported

Measure / Area	Finding in the report
Total sales	Approximately 12.64 million across markets and regions.
Total profit	Reported as approximately 1.47 million.
Regional sales	Asia Pacific was the leading market by sales, followed by Europe; Africa was the lowest.
Product sub-categories	Phones, Chairs, Copiers, and Bookcases are highlighted in the report's analysis.
Customer segments	The Consumer segment is reported as having the largest share of quantity.

Note: The source report contains inconsistent figures in its profit-margin calculation (it reports total profit as 1.47 million but uses 1.27 million in the formula). The summary therefore does not state a definitive profit-margin percentage; verify the measure in the Power BI file before publishing it.

Skills Demonstrated

Data cleaning and transformation • Data modeling • DAX calculations • Dashboard design • Data visualization • Business interpretation • Communicating insights

Conclusion

The project demonstrates how retail data can be prepared, modeled, and presented in Power BI to highlight business performance. It provided practical experience with Excel, Power Query, DAX, and interactive reporting, while developing the ability to turn raw data into clear insights for business decision-making.

Prepared from the project report: “Visualisation of Global Superstore Data Using Power BI.”
